

### **DEVELOPMENTAL MILESTONES**

## A Positive Parenting Tool

Focusing on the Development of children from birth to five years of age.

Each child is unique. Each child develops at their own pace as they learn to react to people and the world each child has his or her own style. However, how do you know if your child is on the right track?

From birth a child goes through many physical and mental changes. Although no two children grow at the same rate, experts agree that there are typical signs of development.

Over the page is a list of important developmental milestones. Watch for these milestones in your child.

Delay in any one of these areas can occur temporarily as a result of illness or environmental factors, or it can be an indication of a long-term developmental problem. If your child is not progressing well through these developmental milestones Conductive Education may be able to help. Conductive Education helps children with developmental delay or with motor disorders that originate from damage to the central nervous system. The programme helps these children to be the very best they can be.

The fundamental theory behind Conductive Education is a holistic learning and educational orientated approach that combines medical knowledge and educational methods to enable individuals to learn (or re-learn) how to gain control of their motor functions. Based on the scientific principles of neuroplasticity, the nervous system possesses the capacity to form new neural connections facilitated through a suitably instructed teaching and learning process. Using a typical age-appropriate education curriculum, Conductive Education uses music, rhythm, and repetition to 'teach' the individual each new skill.

Conductive Education is not a miracle cure. However, it does provide parents with an important option, one that has assisted thousands of children throughout the world to achieve greater independence.

# CHILD DEVELOPMENT

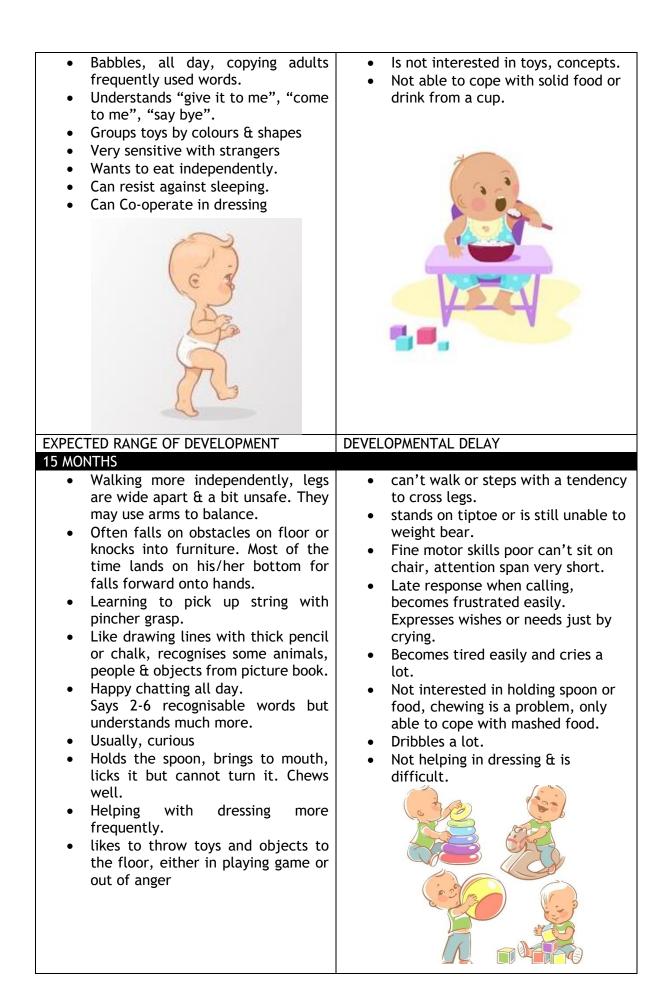

#### WHAT YOU CAN EXPECT

#### The following expected range of child development is an indication only Remember to correct your child's age for prematurity

EXPECTED RANGE OF DEVELOPMENT	DEVELOPMENTAL DELAY
3 MONTHS	
<ul> <li>Voluntary movements appear.</li> <li>Limbs move smoothly &amp; symmetrically.</li> <li>Kick legs alternatively or simultaneously</li> <li>Lifts head &amp; chest up whilst lying on stomach.</li> <li>By 5 months, when lying on stomach can swing straight arms out to the side.</li> <li>Able to put a foot into mouth.</li> <li>Eye-hand co-ordination preformed.</li> <li>Hands loose &amp; open</li> <li>The baby observes and grabs own hands.</li> <li>Starts to keep hitting a toy but misses target. If given a rattle into his/her hand will shake it.</li> <li>Whinges, arbitrary cues, laughs, utter cries, chuckles,</li> <li>Starts to smile at 6 weeks, a month later responds to your smiles or conversation.</li> </ul>	<ul> <li>Lack of voluntary movements.</li> <li>Arm &amp; leg movements, stiff, jerky &amp; asymmetrical</li> <li>Little movement of limbs</li> <li>Low muscle tone</li> <li>Unable to lift head &amp; chest up whilst lying on stomach.</li> <li>Poor head control while pulling up into sitting, head turns to one direction.</li> <li>Hands are still in fist position, unable to bring hands into midline.</li> <li>No or little response to sounds, noise, not turning, looking &amp; following objects from one side to the other,</li> <li>Doesn't smile much appears irritable or very quiet.</li> </ul>
EXPECTED RANGE OF DEVELOPMENT	DEVELOPMENTAL DELAY
<ul> <li>6 MONTHS</li> <li>Able to turn anywhere when sitting or lying on stomach.</li> <li>Creeps &amp; rolls purposely to toys</li> <li>Is able to pull into sitting position &amp; can save themselves if they fall over. They can sit unaided by 8 months.</li> <li>Holds head steady in every position.</li> <li>By 8 months they will be on all fours &amp; can swing backwards &amp; forwards &amp; maybe crawling</li> </ul>	<ul> <li>Legs are stiff &amp; have a crossing tendency.</li> <li>Difficult to change nappies or dressing.</li> <li>Body position is asymmetrical one hand still in fist.</li> <li>Kicking more obvious on one leg.</li> <li>Head control is still poor.</li> <li>Still not able to roll onto stomach.</li> <li>Significant delay in creeping, rolling, sitting &amp; sits with round back.</li> <li>Stands assisted only on tiptoe.</li> </ul>

•	Weight bears on legs when held at waist. Most can pull up into standing position on wide base, but unable to get down again.	<ul><li>Poor hand-eye control</li><li>Not reaching out easily, lets go of</li></ul>
